

N8N Agentic AI Used Car Sales

Problem Statement

The used car market in India is spread across multiple online platforms, making it difficult for buyers to quickly find vehicles that match their requirements.

Users often need to manually search different websites, compare prices, check specifications, and filter listings based on budget, fuel type, transmission, and location.

This process is time-consuming and can lead to missed opportunities or poor purchasing decisions.

To address this problem, a Telegram-based Used Car Finder Bot was developed using n8n, Google Sheets, and web-scraped vehicle data.

The system allows users to search for cars using natural language queries such as "Toyota Innova under 20 lakh diesel" and instantly receive ranked results with details including variant, year, price, mileage, fuel type, transmission, owner count, posting date, and direct listing links.

This automation simplifies the car discovery process and provides a faster, more user-friendly way to explore used vehicle listings.
